

Throne Ingest PoC + FinOps Calculator

Production-shaped healthtech backend artifact: mTLS ingest, durable async processing, deterministic inference stub, mobile read API, Terraform AWS shape, observability, and cost controls against a \$6/user/month budget.

Architecture	Device -> ingest -> S3/SQS -> processor -> inference -> Postgres/S3; API reads Postgres and issues signed URLs.
Proof points	Local file-backed S3/SQS adapters, Go tests, Terraform modules, Grafana dashboards, SLOs/runbooks, React calculator.
FinOps thesis	At 100k DAU and 2 TB/day target, lifecycle tiering + compression + ARM/Graviton keep infra around \$0.14/user/month in the
What is not real	No PHI, no production AWS credentials, no biological classifier; inference is deterministic synthetic hash output.

Reviewer path: make build; make demo; make run-cost-api; cd web/cost && npm install && npm run dev. Then inspect internal/ingest, internal/processor, web/cost/src/model/cost-model.ts, infra/modules, docs/slo.md, and docs/adr.
